DEEPFAKE SIMULATION

Messaging App Impersonation

A live deepfake voice and video call from a familiar colleague, inside the messaging apps where work now happens.

Your operator, from your security team, red team or MSSP, calls an employee inside Telegram, Signal, a Slack huddle or a Teams meeting, in a colleague's face and cloned voice. It tests the channel employees trust most, because it feels personal.

02

WHERE IT RUNS

The apps employees answer without thinking

Messaging apps carry calls from managers, suppliers and colleagues on the move. A call there skips the habits employees have built for email and the desk phone.

Telegram · Signal · Slack · Teams · WhatsApp

Telegram and Signal

Live voice and video calls over secure messaging, from the operator's own account, signed in with the phone beside them.

Slack and Teams

Live voice and video in Slack huddles and calls, and in Teams meetings.

WhatsApp

Live voice and video calls from WhatsApp Web are limited for now.

Nothing to install

The apps run in a cloud session with a virtual camera, and the face swap on a cloud GPU in the session's region.

03 HOW IT WORKS

From a colleague's photo to a debrief

1 **Choose the app**

Pick the messaging app as the delivery channel, then the use case, the person impersonated, the department and the objective.

2 **Build the persona**

One photo of the colleague, and a cloned voice, a recording or the operator's own.

3 **Place the call**

The operator calls from an account the employee would expect to hear from, with a reason that fits the app.

4 **Reveal and rate**

Reveal the operator's real face and voice, then rate the session and keep the recording for the debrief.

04 SAFEGUARDS

Consented, labelled, revealed

Consent first

Call only employees who have agreed to take part, on accounts they use for work, in the likeness of colleagues who have agreed to lend it.

AI label

The operator can burn an AI-manipulated video label into the video the employee sees.

Always reveal

End every call by revealing the operator's real face and voice, live.

Stop when asked

The operator ends the call the moment the employee asks, and never collects a real password, payment or document.

See it on a call with your own team. Book a walkthrough at www.callstrike.ai
